Product Legend

Every product has been inspected to ensure quality and is matched with the interface of the air cooler

this real-time adjustment function of Danfoss expansion valve is realized through its internal temperature sensing package and balance pipe. The temperature sensing package is tied to the evaporator outlet pipe and can sense the superheated steam temperature at the evaporator outlet, while the balance pipe transmits the actual pressure at the evaporator outlet to the valve body. These two components work together to enable the diaphragm in the valve body to move up and down under the action of pressure, thereby adjusting the opening of the expansion valve and ensuring accurate control of the refrigerant flow.
